

# FOSS

---

Free Open-Source Software

# Context

- Need to integrate large legacy systems
- Systems' documentation may be:
  - ◆ Missing
  - ◆ Too large
  - ◆ Outdated
- Needs to understand a system from its code source
  - ◆ IDE: a minimum
  - ◆ IDE: not enough

# Needs

- Instrumentation
  - ◆ Dynamic analysis
  - ◆ Byte code manipulation
- Modeling
  - ◆ Encapsulates code-level details
- Graphics
  - ◆ Visualization
- Regex-based searching & filtering
  - ◆ Show only objects of interest

# Categories

- Eclipse Platform : the most popular Java IDE
- Eclipse Plug-ins : several of them are free and open
- External Java Libraries : bring features of interest into Eclipse

# Eclipse Platform

- Extensions: everything is a plug-in (except the platform's core)
- Extension points:
  - ◆ Add a menu item into the menu
  - ◆ Add a preference page in the preferences
  - ◆ Add an editor for a kind of file
  - ◆ Add a permanent view
  - ◆ Add documentation in the help pages

# Eclipse Plug-ins

- Bytecode manipulation
- Modeling
- Graphical Libraries
- Parsers
- Integrated Products
- Others

# Eclipse Plug-ins

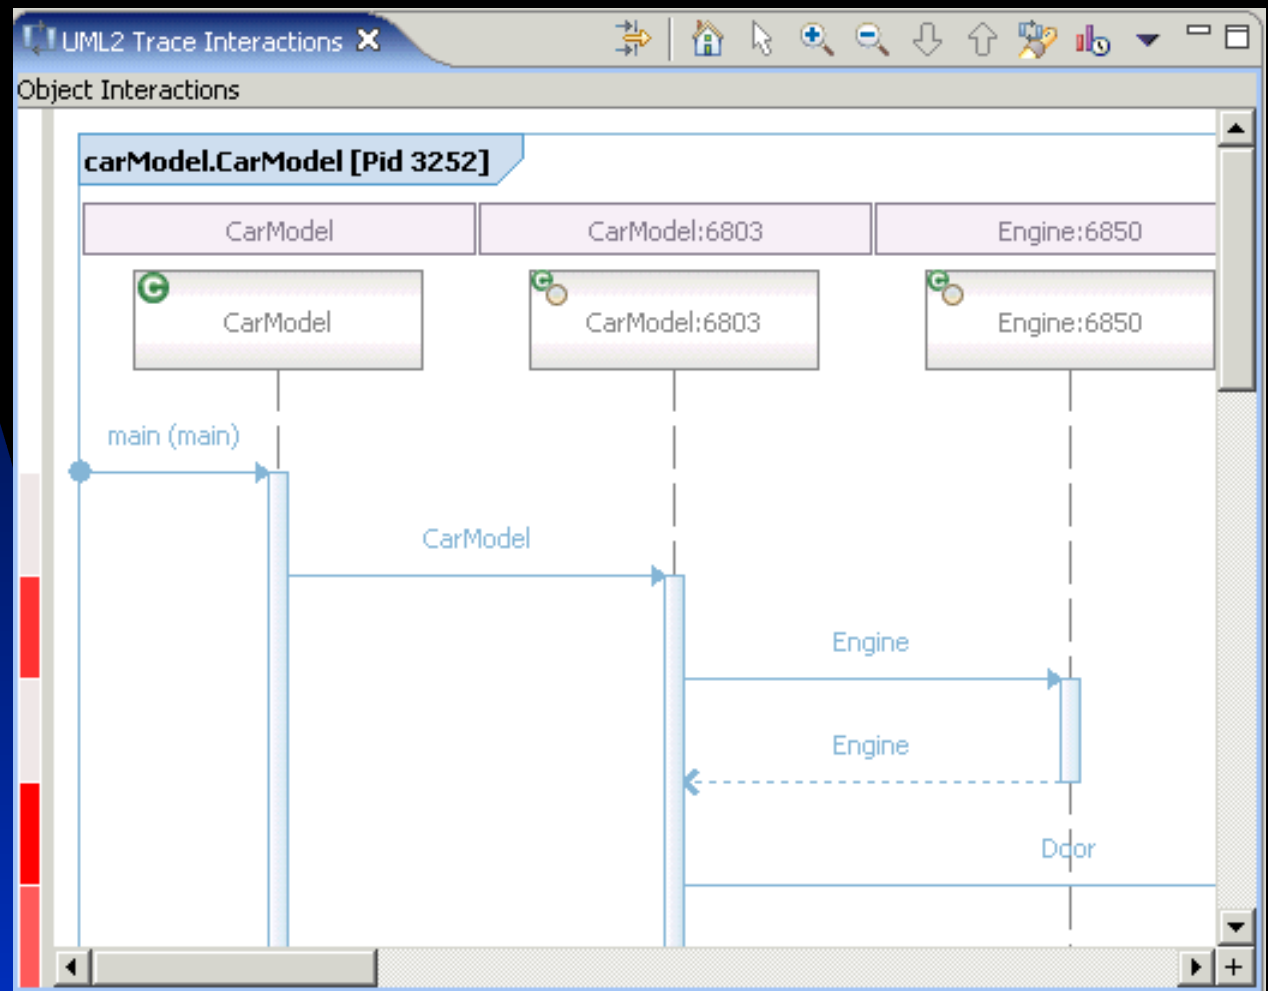

- Bytecode manipulation : TPTP
  - ◆ Test and Performance Tools Platform
  - ◆ Formerly named *Hyades*
  - ◆ Monitors, traces, profiles, instruments.
  - ◆ Divided in four independent sub-projects.
  - ◆ Monitoring and analyzing performance:
    - ★ Profiling
    - ★ Viewing interaction
    - ★ Instrumentation
  - ◆ <http://www.eclipse.org/tptp/>

# TPTP: Profiling

- An *agent controller* controls and monitors JVM activity during an execution
- Limitations:
  - ◆ Supported platforms: Windows, AIX, Linux, Solaris
  - ◆ JVM versions
  - ◆ Languages constructs, such as generics declarations

# TPTP: Viewing interactions

# TPTP: Viewing interactions

- We can:
  - ◆ Collapse/Expand lifelines (by selection, not by applying a package collapse)
  - ◆ Collapse/Expand messages
  - ◆ Drilling down into lifelines (interactions with a specific lifeline)
  - ◆ Highlight a call stack
  - ◆ Viewing time intervals
  - ◆ Searching/Filtering features (limited)
  - ◆ Zooming/Overview diagrams.

# TPTP: Viewing interactions

- We cannot easily control the generation of the sequence diagram:
  - ◆ To change B/G and F/G colors
  - ◆ To filter out undesired items
  - ◆ To view package interactions
  - ◆ To add stereotypes and icons
  - ◆ To specify domain-related items (items of interest for an application domain).
- We didn't find how to generate sequence diagrams from external traces (such as JRAT traces)

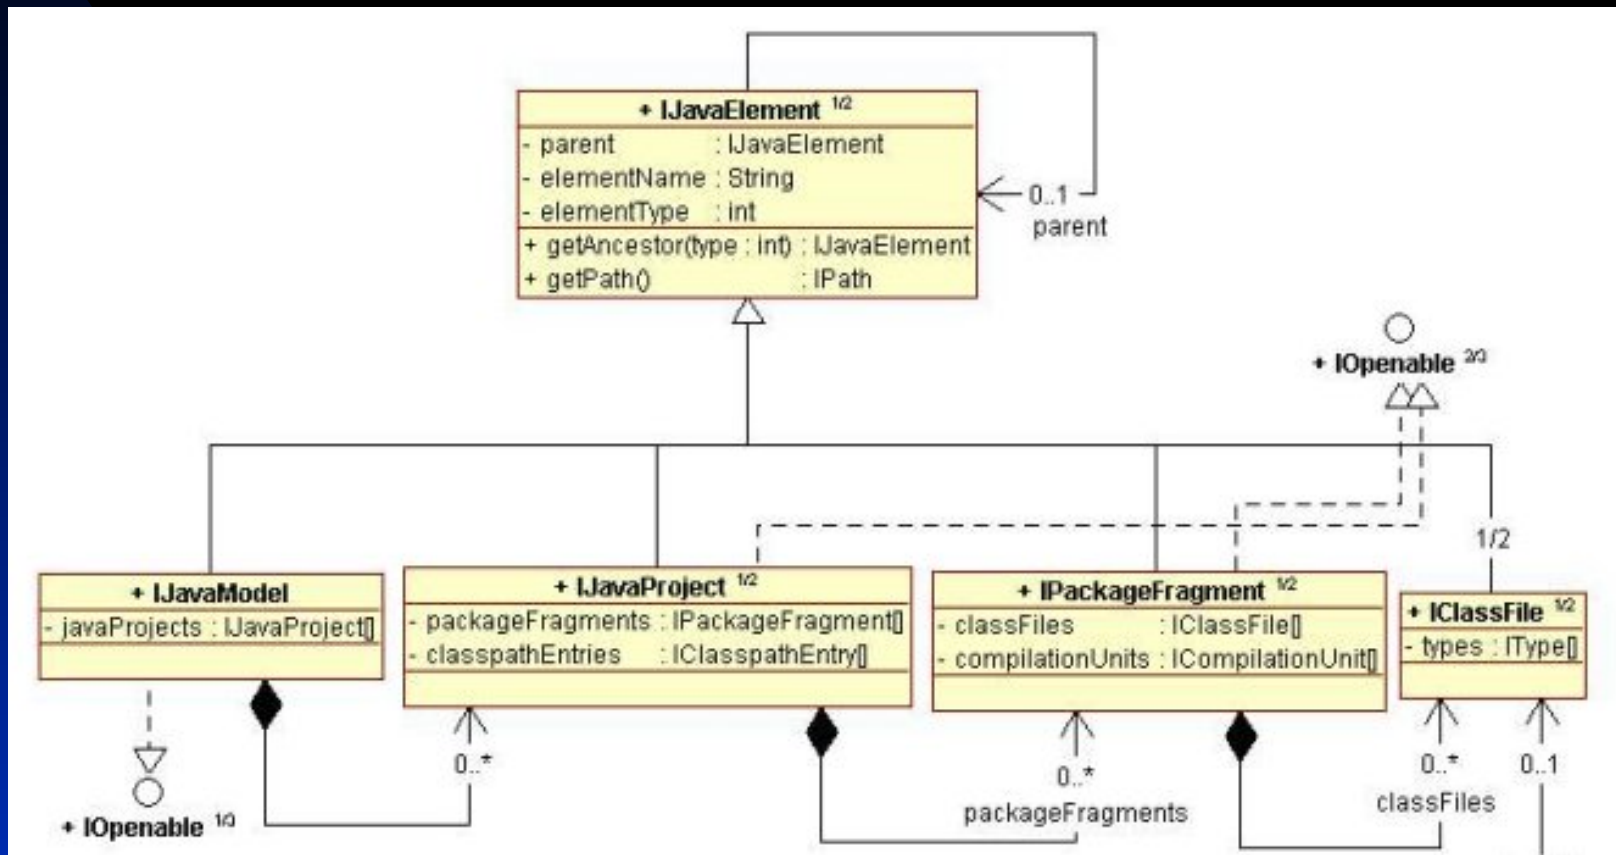

# TPTP: Instrumentation

- Probekit:
  - ◆ A probe can be inserted into .class code
  - ◆ The probe calls user-defined code
  - ◆ Some info available from the probe:
    - ★ Caller name, object instance, etc.
  - ◆ The probe may be inserted to:
    - ★ Called methods : monitors instrumented application
    - ★ After/before calls : monitors Java library and 3<sup>rd</sup> party
    - ★ Both
  - ◆ We can make a probe generating XML-formatted traces.

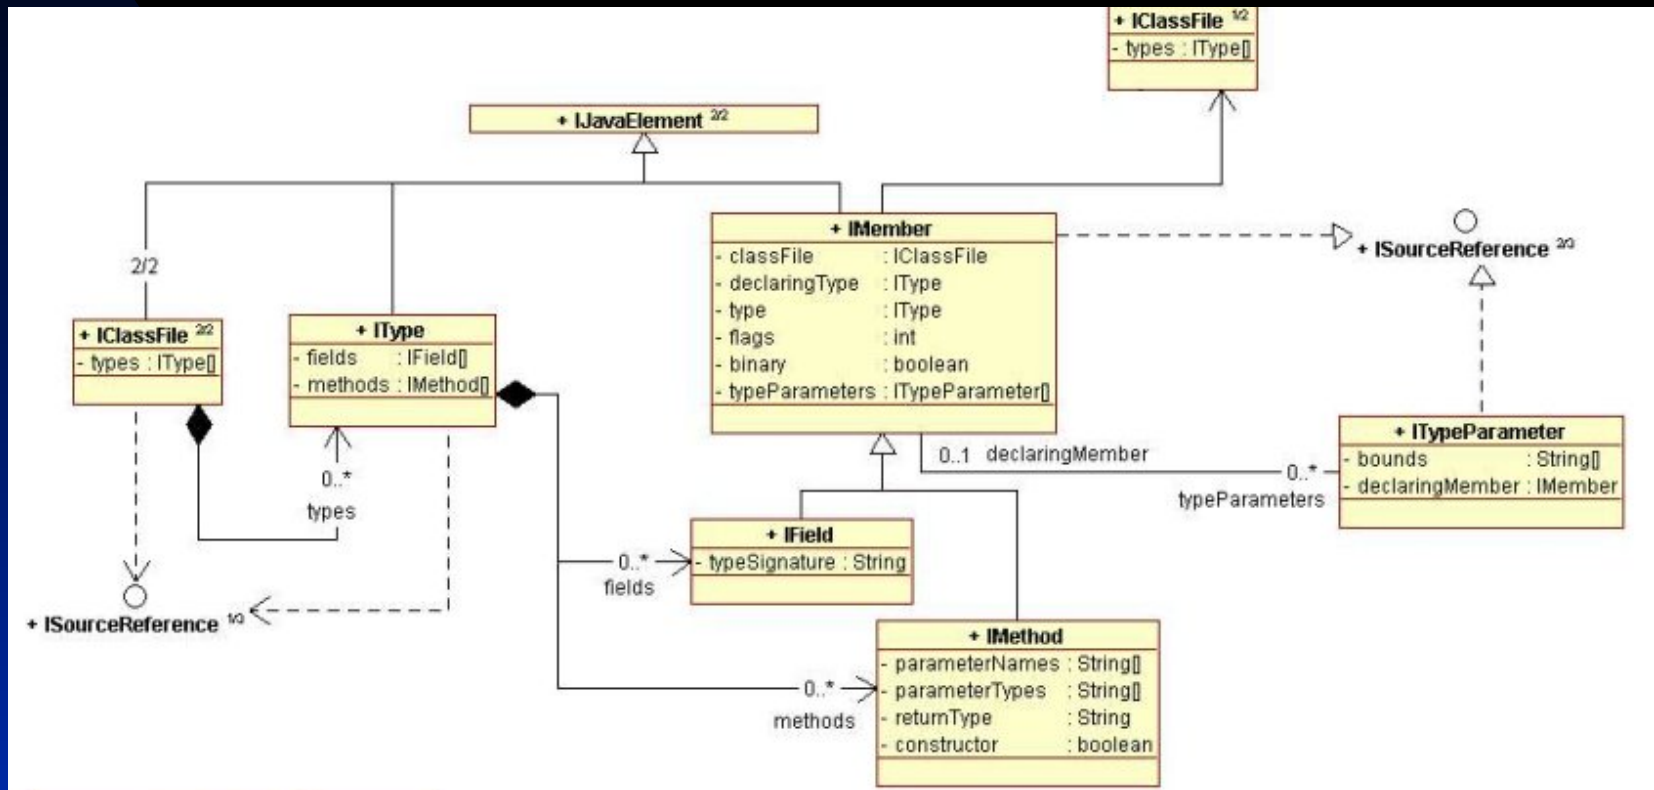

# Eclipse Plug-ins

- Modeling
  - ◆ JDT (Java code level)
    - ★ Includes a parser  
(org.eclipse.jdt.internal.compiler.parser)
    - ★ Generates a model of Java objects
  - ◆ EMF (UML level)
    - ★ Models UML objects instead of Java objects
  - ◆ Others (CDT, RDBMS)
    - ★ Making Eclipse a language-neutral IDE

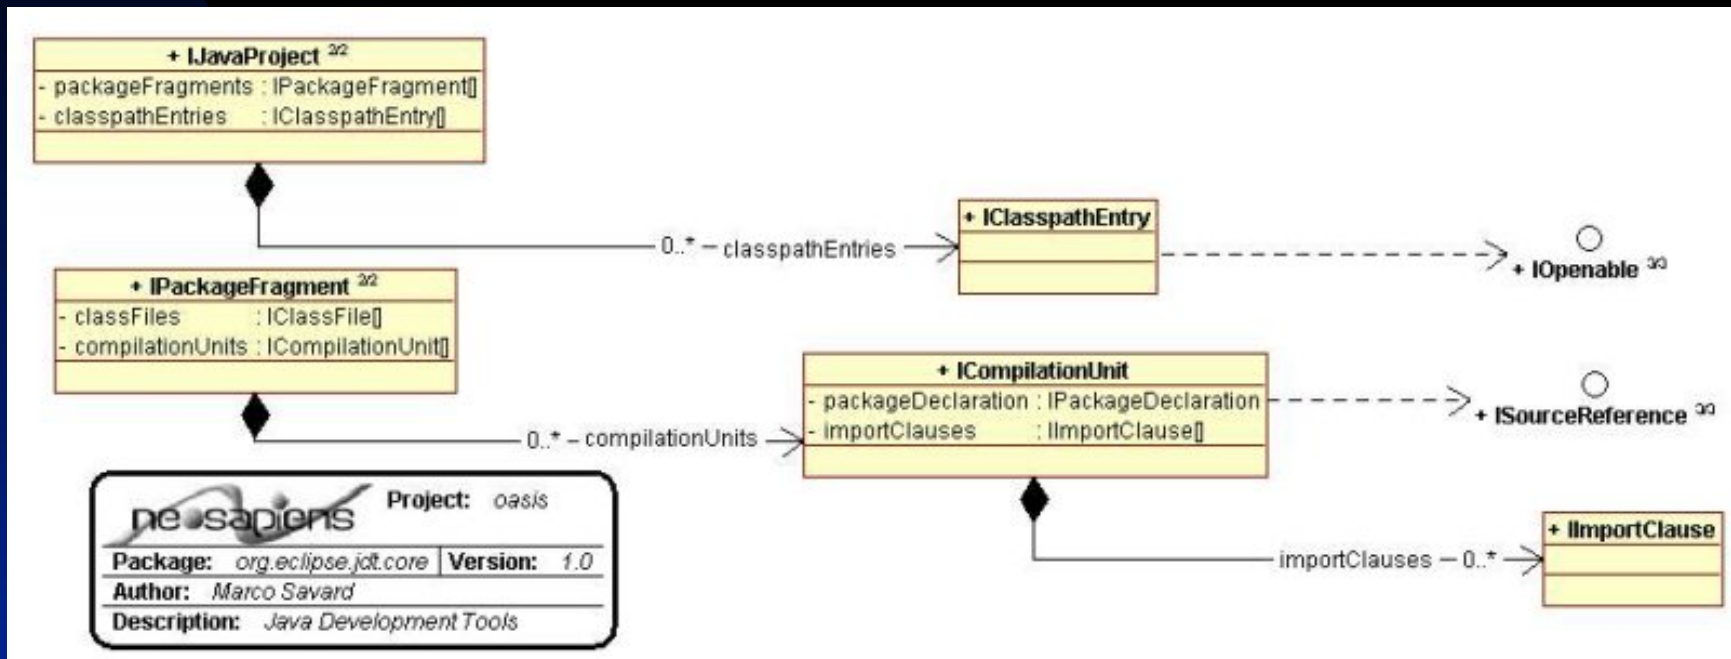

# JDT : *openable* classes

# JDT : source references

# JDT : package and compilation units

# Eclipse Plug-ins

- Graphic Libraries
  - ◆ SWT : A widget library
    - ★ User has to create Tree, TreeItem
  - ◆ Jface : Integrating model and view
    - ★ User creates a TreeViewer, TreeContentProvider from a data model, abstracting the widget level.
    - ★ High-level widget: wizards.
  - ◆ Draw2D : a low-level drawing library
    - ★ Equivalent to org.eclipse.swt.graphics
  - ◆ GEF : a diagramming framework

# Graphical libraries: complexity and dependencies

	giny 89 classes			
net.claribole.zvtm: 165 classes	edu.umd.cs.piccolo 130 classes	org.tigris.gef: 229 classes	org.eclipse.gef: 308 classes	
javax.swing : 540 classes			org.eclipse.draw2d: 227 classes	org.eclipse.jface: 337 classes
java.awt : 345 classes			org.eclipse.swt : 569 classes	
java without awt : 835 classes (java 1.4)				

- Standard libraries : magenta
- Eclipse plug-ins : green
- 3<sup>rd</sup> party libraries : red

# Eclipse Plug-ins

- **Parsers**
  - ◆ **ANTLR**
    - ★ generates a Java parser from a .g grammar file
  - ◆ **JavaCC**
    - ★ generates a Java parser from a .jj grammar file
  - ◆ **JDT built-in parser**
    - ★ parses only java files
  - ◆ **XML parsers**
    - ★ Xerces.jar : org.w3c.dom
    - ★ Since java 1.4 : javax.xml
  - ◆ **XSD (required by TPTP)**
    - ★ [www.eclipse.org/xsd](http://www.eclipse.org/xsd)

# Eclipse Plug-ins

- Integrated Products
  - ◆ Spider
  - ◆ Junit
  - ◆ Metrics
  - ◆ UML Modeler
    - ★ Omondo (free version)
    - ★ Slime UML (not free)
    - ★ Modelistic (not free)

# Eclipse Plug-ins

- Others
  - ◆ Ant : to run build.xml Ant scripts)
  - ◆ Log4J : required by SEQUENCE)
  - ◆ OSGi : required by PDE
    - ★ (Plug-in Development Environment)
  - ◆ TextEditor :
    - ★ org.eclipse.ui.editors.text.TextEditor
  - ◆ XMLEditor :
    - ★ Not found in the Eclipse framework
    - ★ More convenient to edit XRAT files

# External Libraries

- ◆ JRAT : BCEL-based class instrumentor
  - ★ Simpler, more reliable than TPTP's probekit
  - ★ Limitations: ignore client calls, constructors
- ◆ BCEL : low-level byte code manipulation
- ◆ JavaHelp : required by SEQUENCE
- ◆ Regular expression :
  - Gnu's version : org.gnu.regex
  - Java.util.regex : since JDK 1.4

# BCEL usages

- ◆ To pass byte code object to JRAT

```
JavaClass source, target; //BCEL objects  
InjectionCriteria criteria; //JRAT objects
```

```
target = ClassInjector.injectClass(source, criteria);
```

- ◆ To convert method signatures found in .xrat

```
String signature = "Ljava/lang/String;Z";  
org.apache.bcel.generic.Type[] types;  
types = Type.getArgumentTypes(signature);  
//types[0].toString() equals "java.lang.String"  
//types[1].toString() equals "boolean"
```

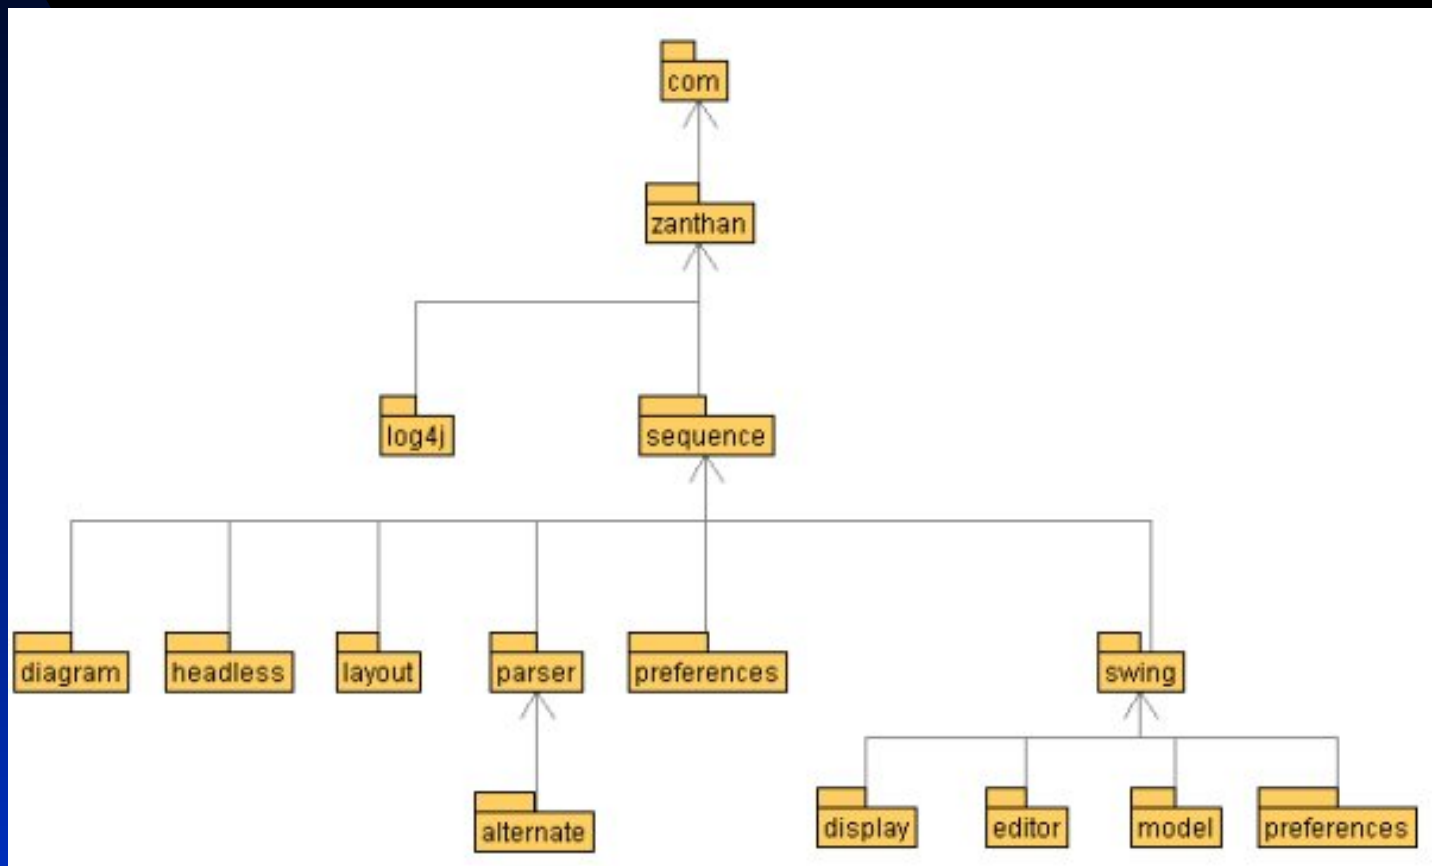

# External Libraries : SEQUENCE

- ◆ A simple Swing-based program
- ◆ A conversion to SWT is required to run it within Eclipse
- ◆ Future enhancement: convert to a diagramming framework (gef, piccolo).
  - ★ Zooming/Scrolling support
  - ★ Direct manipulation of graphical elements (move, resize, in-line editing)

# SEQUENCE : architecture

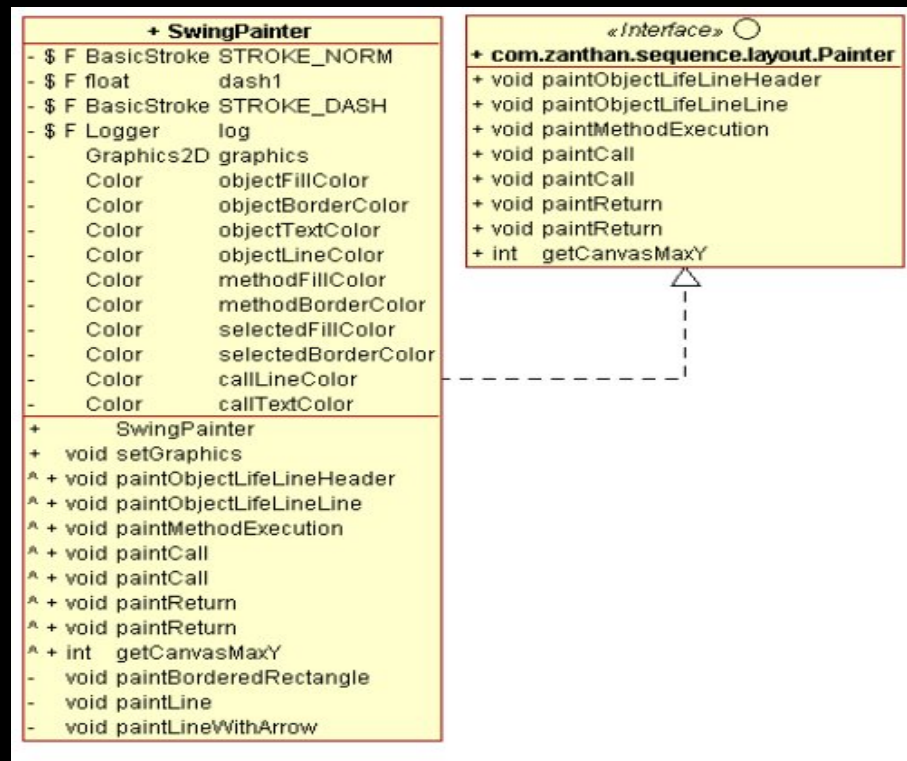

- ◆ 15 packages
- ◆ 70 classes

# SEQUENCE : Painter

No code in the Painter interface

A concrete SWTPainter could be implemented

# The OASIS plug-in

- Instrumentation based on JRAT and Prokebit
- Uses SEQUENCE to show class interactions

# SEQUENCE

- Changes to the original tool
- Swing to SWT conversion
